The Senioritis Application
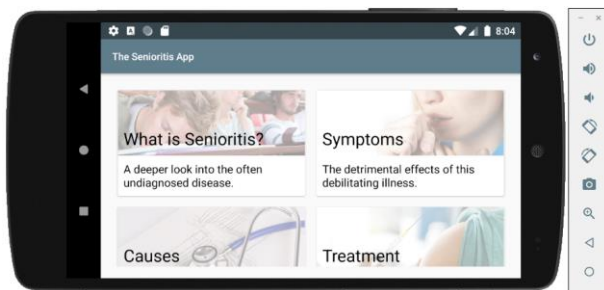

Description: The Senioritis Application (TSA) is meant to provide its' users with clear, digestible information about the disease known as Senioritis.

A typical user experience would include navigating through the topics, reading the information provided, and filling out a 6-question testing quiz. The quiz will try to determine whether that individual has Senioritis based on how they answered.
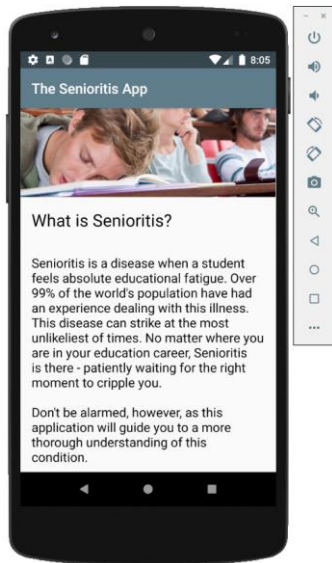

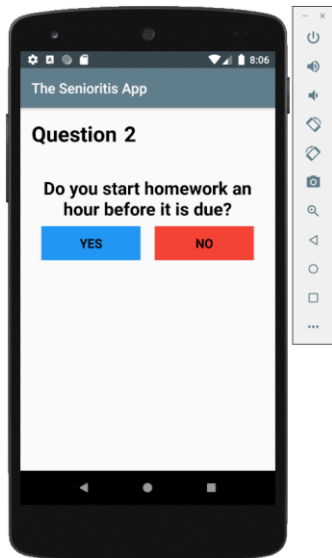

Main Features:

Our design includes a Main Screen using a Recycler View paired with Cards to display each topic. Each Card can be selected and further explored with more information regarding Senioritis.

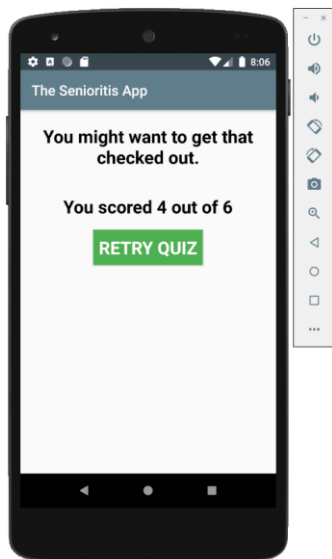

Rotating the device will modify the view so that two columns of Cards can be shown.

Each Card can be selected, as shown here, to provide more context to that particular topic.

A test can be taken which will give the users questions to answer to determine whether or not they are afflicted with Senioritis.

Finally, after taking all questions in the test, a results page will provide the user with feedback as to whether they have the disease based on the answers given.
